The classification is quite accurate, especially the composition, distribution and relationship category charts. The comparison category of charts, however, is hard to distinguish from relationship and profiling category charts. Bar and grouped bar charts are both charts which fall into the comparison category of charts. Grouped bar charts are already classified as profiling charts. Profiling is a bad classification for a category of charts because all categories charts are profiling charts. Profiling can mean extrapolating information from something, which is what charts do. Additionally, bar charts should be under composition because each bar makes up an entirety of something.
