Journal Entry #23

- 1) I am not convinced of the maximum line length guideline. First of all, developers' monitor sizes may vary such that 79 characters may not fill an entire line. Developers' monitor sizes may also be small (e.g if they are working from a laptop) such that 79 characters may fill up several lines.
- 2) The blank line guideline is not justifiable to me. I would prefer the inclusion of blank lines such that the readability of the code is maximized on many different screens.
- 3) The whitespace guideline is not justifiable to me. I think the code is much easier to read if there is more whitespace. Also, the inclusion of whitespace varies depending on the coding style of the developer. The whitespace guideline seems to be a biased guideline based on the coding style of the author of the article.
